Project Name	Employee ID Card Request System
Maximum Marks	2 Marks

Customer Problem Statement:

Many organizations still handle employee ID card requests through manual processes such as emails, paper forms, or verbal communication. This often leads to delays in processing, difficulty in tracking request status, and increased administrative workload. Employees may experience inconvenience when requesting a new or replacement ID card due to the lack of a standardized and transparent request process.

Furthermore, the absence of an automated approval workflow makes it difficult to ensure timely authorization and efficient communication between employees, managers, and the administration team. Manual processing can result in missed requests, inconsistent record management, and unnecessary delays in issuing employee ID cards.

The proposed **Employee ID Card Request System** leverages ServiceNow to automate the complete request lifecycle. Employees can submit requests through a Service Catalog item by providing their details and the reason for the request. The system automatically routes the request for approval, sends an email notification after approval, and creates a catalog task for the administration team. This automation reduces manual effort, improves request tracking, enhances transparency, and ensures faster processing of employee ID card requests.
