Proposed Solution

1. Problem Statement

Many organizations still process employee ID card requests manually through paper forms or emails. This often results in delays, difficulty in tracking requests, increased administrative effort, and poor communication between employees and administrators. An automated system is required to simplify and streamline the entire request process.

2. Idea / Solution Description

The proposed solution is an **Employee ID Card Request System** developed on the ServiceNow platform. Employees can submit requests for a new or replacement ID card by entering their Employee Name, Department, and Reason through a Service Catalog item. The system automatically routes the request for approval using Flow Designer. Once approved, an email notification is sent to the employee, and a Catalog Task is created for the administration team to issue the ID card.

3. Novelty / Uniqueness

The solution integrates ServiceNow Service Catalog, Flow Designer, Approval Workflow, Email Notifications, and Catalog Task Management into a single automated process. It eliminates manual request handling and provides complete visibility of the request lifecycle from submission to task completion.

4. Social Impact / Customer Satisfaction

The system minimizes paperwork, reduces request processing time, and provides employees with a faster and more transparent way to request ID cards. Automated approvals and notifications improve communication and increase overall user satisfaction while reducing the workload of the administration team.

5. Business Value

The solution improves organizational efficiency by automating repetitive administrative tasks and maintaining centralized digital records. It reduces manual errors, enhances productivity, and provides a scalable workflow that can be extended to other employee service requests within the organization.

6. Scalability of the Solution

Built on the ServiceNow cloud platform, the application can easily support a larger number of employees and requests. Additional features such as multi-level approvals, status tracking, document attachments, and reporting can be incorporated in future versions without significant changes to the existing workflow.
