Solution Architecture

The **Employee ID Card Request System** is developed on the ServiceNow platform using a layered architecture to automate the complete ID card request process. Employees interact with the application through a Service Catalog item by entering their Employee Name, Department, and the Reason for requesting a new or replacement ID card. Once the request is submitted, Flow Designer automatically initiates the approval workflow, sends an email notification after approval, and creates a Catalog Task for the administration team to process the request.

- **User Interaction Layer:** Employees access the Service Catalog to submit ID card requests by providing the required information. The interface offers a simple and user-friendly method for initiating the request.
- **Business Logic Layer:** Flow Designer manages the complete workflow by collecting catalog variables, routing the request for approval, verifying the approval status, sending email notifications, and automatically creating a Catalog Task for the administration team.
- **Data & Service Layer:** ServiceNow stores request details, approval records, and catalog tasks in its database tables. The platform also manages email notifications and maintains all request records for tracking and future reference.
